DIVANEX TECHNOLOGIES

Admin Handbook

Running the website without touching the code

Who can do what, which screen owns which part of the site, how to carry out the jobs that come up most often — and, just as important, the things this console deliberately cannot do.

Written for	**The Divanex team managing content and SEO**
Console	**divanextechnologies.com/admin**
Prepared	**16 October 2026**

4 Which screen owns which part of the site

5 How to do the jobs that come up most

6 What this console cannot change

7 What is not built yet

8 Where to look when something is wrong

PART 1

Signing in

The console lives at `https://www.divanextechnologies.com/admin`.

1. Enter your email address and password.
2. A six-digit code is emailed to you. Enter it on the next screen.
3. The code is single-use and expires. If it does not arrive within a minute, check spam, then request a new one.

Every screen has its own address, so a link can be shared or bookmarked. Add `?tab=` and the screen name:

SCREEN	ADDRESS
Page Content	`/admin?tab=pages`
Page Sections	`/admin?tab=sections`
Blog CMS Studio	`/admin?tab=blog`
Portfolio & Cases	`/admin?tab=portfolio`
Services Catalog	`/admin?tab=services`
Header & Footer Menus	`/admin?tab=navigation`
Search & Metadata	`/admin?tab=seo`
Admins & Roles	`/admin?tab=users`
Audit Trail	`/admin?tab=audit`

> **A bookmarked link is not a way around your role.**
> Opening the address of a screen your role does not cover shows a short notice instead, and the data behind it is refused separately by the server.

PART 2

The four roles

Every admin account holds exactly one role. Only an **Owner** can add an admin or change anyone's role — including their own.

CAN DO	OWNER	MANAGER	EDITOR	VIEWER
Read every content screen	Yes	Yes	Yes	Yes
Edit pages, services, cases, posts	Yes	Yes	Yes	—
Reply in live chats	Yes	Yes	Yes	—
Manage subscribers	Yes	Yes	—	—
Edit client sprints	Yes	Yes	—	—
Search & Metadata, System Settings, Cache	Yes	Yes	—	—
Read the audit trail	Yes	Yes	—	—
Add, remove or re-role admins	Yes	—	—	—

In screen counts: Owner and Manager see all 24; Editor and Viewer see 17. The seven hidden from them are Search & Metadata; Backup, Audit & Search; Cache & Performance; Audit Telemetry; Audit Trail; Admins & Roles; and System Settings.

> **A Viewer sees the screens but cannot save.**
> This is on purpose. Someone can be shown exactly what is on the site and be walked through it without any risk of a change.

Every change is recorded

The Audit Trail stores who made each change, when, from which address, and the value *before* and *after* for each field. It also records refusals — an attempt to reach something out of reach is logged too. Passwords, tokens and codes are never written into it.

PART 3

The one rule to remember before you edit

> **Saving publishes. There is no draft step.**
> The moment you press Save on a content screen, the change is on the live website. There is no preview, no second button, and no approval. Write the text somewhere else first if you are not sure of it.

Two exceptions, both of which do have a held-back state:

- **Blog posts** carry a status. A post set to *draft* is not published and does not appear in the sitemap.
- **Pages** can be set to *noindex* under Search & Metadata. The page still exists and anyone with the link can read it; it is only kept out of search results.

Undoing a mistake

There is no one-click revert. What you do have:

- The Audit Trail shows the previous value of the field, so it can be typed back in.
- Backup, Audit & Search takes a copy of every content record. Take one before any large edit — that is what it is for.

Deleting

Deleting a page, service or case study makes its address return *Not Found*. Anything already linking to it — a menu item, a line in another page, a result in Google — breaks. The console asks you to confirm; read the address in the confirmation before agreeing.

PART 4

Which screen owns which part of the site

SCREEN	WHAT IT CONTROLS
Telemetry Overview	Counts of what is published, enquiries received, and the last changes made. Read-only.
Site Content & CMS	Company name, address, phone, email, office hours, WhatsApp number, social links, footer tagline and footer columns. These appear on every page, so a change here is site-wide.
Header & Footer Menus	Every menu item and its destination, the mega-menu panels, the navbar buttons, and the footer link columns.
Page Content	The top of each page — badge, heading, highlighted heading, description, the two buttons and their links, and the four statistic tiles.
Page Sections	Everything further down each page: headings, body copy, list items and the closing call-to-action. Grouped by the page it belongs to.
Services Catalog	The service list and each service's own page — summary, features, use cases, technologies, FAQs, call-to-action.
Portfolio & Cases	Portfolio cards and the full case study behind each one. *See the warning in Part 5.*
Tech Stack Registry	The technology list and each technology's own page.
Client Reviews	Testimonials: quote, name, company, role, project.
Blog CMS Studio	Articles — title, address, excerpt, body, cover image, author, category, tags, date, publish status and search metadata.
Legal Pages	Privacy, Terms, Cookies, NDA and Refund Policy.
Forms & Notifications	Enquiry form fields and dropdown options, where submissions are emailed, and the wording of the automatic reply.
Search & Metadata	Per-page search title and description, social share image, the canonical domain, Search Console and Bing tokens, and the Google Analytics measurement ID. *Manager and Owner only.*
Sitemap / Robots & Crawlers	Which addresses are offered to search engines and which crawlers are allowed where.
Newsletter Subscribers	The subscriber list, with export.
Live AI & Support Chats	Conversations from the website chat widget.
Client Sprints	Internal project tracking. Nothing here is published.
Backup, Audit & Search	Search every record at once, find links pointing at pages that no longer exist, and take a backup.
Admins & Roles	Admin accounts and their roles. *Owner only.*

Audit Trail	The full record of who changed what, with before and after.

PART 5

How to do the jobs that come up most

Change wording already on a page

1. Is it in the top block of the page — badge, big heading, the two buttons, the four tiles? Use **Page Content**.
2. Anything further down the page? Use **Page Sections**, then pick the page.
3. Is it in the header, the footer, or on every page? Use **Site Content & CMS** or **Header & Footer Menus**.
4. Edit, Save, then open the live page and confirm.

Add a service

1. **Services Catalog** → Add service. Give it a name and an address (lowercase, hyphens, no spaces).
2. Fill in the summary, features, use cases, technologies and FAQs.
3. The page goes live at `/services/your-address`.
4. Give it a search title and description under **Search & Metadata**, or it inherits the site default.
5. Add it to a menu under **Header & Footer Menus** if people should be able to find it.

Add a case study

> **A portfolio card and its case study are two separate records.**
> Adding a project creates the card only. Until the write-up exists the card shows with no link, because a link would open a page that does not exist. The Portfolio screen lists the projects still waiting on one.

1. **Portfolio & Cases** → add the project. Note the id it is given.
2. Open the case study pages editor and add a page using *that same id* as the address.
3. Write the overview, the challenge, the solution, the outcome.
4. Reload the portfolio page — the card now links to it.

Only publish an outcome or a client name you can stand behind. A figure on a case study is a claim the company is making.

Publish a blog post

1. **Blog CMS Studio** → new article.
2. Write it with the status left on *draft* — a draft is not public and is kept out of the sitemap, so you can work over several sittings.
3. Fill in the excerpt, cover image, author, category and tags.
4. Link to at least one service page from inside the article.
5. Set the status to *published* when it is ready.

Change how a page appears in Google

1. **Search & Metadata**, then pick the page.
2. Title: aim for under 60 characters. Description: under 160.
3. *Noindex* keeps the page out of search while leaving it reachable by anyone with the link.
4. Google re-reads pages on its own schedule. A change here is live immediately; the search result catches up later.

Point analytics at a different property

Search & Metadata → Google Analytics measurement ID. Paste the `G-` value from the GA4 property. Leaving it empty stops all reporting and removes the tag from the site entirely. The admin console is never counted — those are staff, not visitors.

PART 6

What this console cannot change

These need a developer and a deployment. That is not a shortcoming — it is the line between editing content and changing the application.

NEEDS CODE	WHY
A new kind of section or layout	Existing section types can be edited, reordered and refilled. A new arrangement has to be built.
Colours, fonts, spacing, the overall design	Held in the stylesheet, deliberately, so the site cannot drift out of brand one edit at a time.
A whole new page type	For example country or city pages, which do not exist yet.
New integrations	Payments, a CRM, a different mail provider.
Login rules, permissions, security	Changing these from a web form would defeat them.
Redirecting an old address to a new one	Not built yet. See Part 7.

> **Do not paste HTML or scripts into a content field.**
> Fields take text and simple formatting. Anything else is escaped rather than run — by design, because a content box that executes code is the easiest way into a website.

PART 7

What is not built yet

Listed plainly so nobody goes looking for a button that is not there.

MISSING	WHAT TO DO INSTEAD
Draft and preview for pages	Saving publishes. Draft the wording elsewhere, then paste it in. Blog posts are the exception — they have a real draft state.
Rollback	The Audit Trail shows the old value; type it back. Take a backup before a large edit.
Media library	There is no uploader. Images are referenced by web address, so host the file elsewhere and paste the link.
Redirects	Changing or deleting an address breaks the old one. Ask a developer to add a redirect before changing an address that has been shared or indexed.
Location pages	None exist. They need both a developer and genuine local detail for each market — the same page with the country name swapped is worse than no page.
Scheduled publishing	Publish by hand at the time you want it live.
SEO warnings	Nothing flags a duplicate address, an over-long description or a missing image description. Check these yourself for now.

PART 8

Where to look when something is wrong

SYMPTOM	FIRST THING TO CHECK
The edit saved but the site looks unchanged	Hard-refresh the page. If it is still stale, use Cache & Performance to clear the cache for that area.
A red banner at the top of the console	The database is unreachable. Nothing will save. Stop editing and tell a developer — carrying on risks losing the work.
A screen is missing from the sidebar	Your role does not cover it. Check Part 2 and ask an Owner.
Enquiries have stopped arriving	Forms & Notifications → Check mail server. It tests the credentials without sending anything. Also check the recipient address on the same screen.
A link on the site leads nowhere	Backup, Audit & Search finds links pointing at pages that no longer exist.
Analytics shows nothing	Confirm the measurement ID under Search & Metadata, then check Realtime in Google Analytics while loading the site yourself.
Something changed and nobody admits it	The Audit Trail has the name, the time and the exact before and after.

Things that live outside this console

WHAT	WHERE
Visitor numbers and traffic	Google Analytics
Search performance and indexing	Google Search Console
Hosting, deployments, uptime	Vercel
The database and its backups	Supabase
Email delivery	The SMTP provider

> **The Overview does not show traffic or revenue.**
> The website does not collect either, so no figure for them is shown rather than an invented one. Traffic lives in Google Analytics; uptime lives in Vercel.
